HELPING TRAINEES SEE WHAT THEY’RE LEARNING.

The McGrath™ MAC video laryngoscope

Medical students from across Scotland visit the Royal Hospital for Sick Children in Edinburgh to learn pediatric anesthesia. And members of the hospital’s anesthetics team say that the McGrath™ MAC video laryngoscope has transformed their teaching practice. Here’s how.

Training for safe intubations — and peace of mind

“By using a [McGrath™ MAC] video laryngoscope, we were able to show them exactly what they should be seeing. You could watch them intubate and you could relax, knowing they were able to intubate patients while you were keeping an eye on what was happening.”

— Dr. Alistair Baxter

“We have safer methods of teaching with [the McGrath™ MAC video laryngoscope]. Also, it decreases the amount of attempts that we need. We get better* views of the larynx, and we have shown that through our own work in this hospital. Ultimately it has led to a safer practice within the hospital.”

— Dr. Omar Malik

A focus on confidence

“The main benefit of [the McGrath™ MAC video laryngoscope] has been being more confident and comfortable allowing trainees to manage younger and younger patients. [Now] we can confidently see what they are doing and guide them optimally much more than you could with direct laryngoscopy.”

— Dr. Suzanne Krosnar

“The main benefit for us is that we can actually see where they’re trying to place the tube. [The McGrath™ MAC video laryngoscope] makes our job, I think, a lot easier.”

— Carol Clapperton

*Compared to direct laryngoscopy
