This guide is provided as a convenience companion document to the operator’s manual. It is not intended to replace the operator’s manual, which should always be available while using the ventilator. It is important to familiarize yourself with all information in the operator’s manual relevant to your institution’s use of the ventilator, including on-screen helps, instructions, warnings, and cautions.
1. Connect the breathing circuit as shown.
2. Connect the oxygen reservoir* to the ventilator and connect tubing to the oxygen cylinder.
3. Turn on the ventilator (the switch is on the back).

4. Select desired mode and breath type, and set according to physician orders.

5. Touch “Alarms” to open the alarm screen. Set alarms as per your facility’s protocol, then press “Accept.”

6. Touch “Start Ventilation.”

7. Attach vent circuit to patient.

8. Visit “More” for additional options to optimize breath type, as needed.

Please note: The ventilator has up to 10 hours of battery life depending on settings. If AC power is needed, attach the power cord.

*Or air/oxygen mixer (must be connected to oxygen source prior to attaching to HT70)
