MEASUREMENTS THAT MATTER IN THE MOMENT

Continuous and objective blood flow measurements on the table, so you know your work is working.

FlowMet™
Peripheral Blood Flow Monitoring System
THE CHALLENGE

When it comes to gauging the impact of peripheral arterial disease (PAD) revascularizations, angiography cannot fully assess distal blood flow.¹² Is there a way to reduce procedural uncertainty by directly measuring blood flow?

INTRAPROCEDURAL BLOOD FLOW MONITORING*

The FlowMet™ System:
- Provides real-time, quantitative measurement of volumetric blood flow to distal tissue bed³⁴
- Supplements angiography to support procedural insights⁴
- Continuously monitors blood flow changes throughout the intervention without inhibiting workflow⁴
- Noninvasive, simple, and easy to use

¹FlowMet device is only cleared for measuring blood flow as an intraprocedural monitoring device, and is intended to supplement angiographic assessment and other vascular assessment tools. FlowMet is not indicated to diagnose disease.
QUANTIFY AND CHARACTERIZE BLOOD FLOW

- Flow value quantifies volumetric blood flow through a calibrated numeric scale\(^4\)
- Waveform reflects real-time changes in blood flow during the cardiac cycle, enabling the characterization of blood flow as normal or abnormal\(^5\)
- Working together, these two measurements allow observation of baseline values and changes in blood flow throughout the procedure\(^6\)

HOW DISEASE IMPACTS FLOW WAVEFORM

- The presence of vascular disease alters waveforms
- The more severe the disease, the more abnormal the waveform will appear\(^5\)

\(^*\)Images are for illustration purposes only and may vary according to sensor location and disease stage.
FLOWMET™ DISPOSABLE SENSOR TECHNOLOGY

- Simply affix the disposable FlowMet™ sensor to the patient’s toe at the beginning of the procedure
- Laser light is transmitted through the entire digit, enabling measurement of the full tissue volume
- Using laser speckle imaging, the system continuously measures changes in blood flow during a case
- Blood flow movement alters the speckle pattern, and these real-time changes are reflected in the measurements on-screen

IMPORTANT: Indications, contraindications, warnings, and instructions for use can be found in the product labeling supplied with each device.

INDICATIONS FOR USE: The FlowMet™ is a noninvasive probe that is affixed to the fingers or toes and intended to quantify tissue blood flow rate.

CAUTION: Federal (USA) law restricts this product for sale by or on the order of a physician.
