Gut sutures are not indicated for use in cardiovascular or neurological surgery, microsurgery, or ophthalmic surgery. Gut sutures, being absorbable, should not be used where extended approximation of tissue is required. Adverse effects include but not limited to wound dehiscence, variable rates of absorption over time (depending on the type of suture used, the presence of infection and the tissue site), failure to provide adequate wound support in sites where expansion, stretching or distension occur failure to provide adequate wound support in patients with conditions which may delay wound healing, allergic response, including delayed anaphylactic reaction, in patients with known sensitivities to bovine collagen or chromium, sinus formation, calculi formation when prolonged contact with salt solutions occurs, potential for infection, minimal acute inflammatory reaction, and transitory local irritation. Please refer to IFU for complete contraindication and risk information.
