Medtronic

Puritan Bennett™ cuff pressure manager

# Cuff pressure management made simple

Manually sustaining stable cuff pressures in your ventilated patients is inherently unreliable.

Our cuff pressure management tool offers a simple solution to a serious safety issue by continuously measuring and automatically maintaining cuff pressure.

# Continuously measured, always managed

Help protect your patients against common and costly tracheal injuries and VAP caused by cuff overinflation and underinflation[1-7] with the Puritan Bennett™ cuff pressure manager – a simple and reliable way to monitor and maintain cuff pressure.

Our cuff pressure management solution is designed to take the pressure off you:

- Reduces manual work of measuring and adjusting cuff pressure with a manometer and syringe[4,6,8]
- Provides 24-hour uninterrupted monitoring and management
- Improves adherence to established cuff pressure protocols[2]

## Easy operation to support your range of needs

Our cuff pressure manager is designed around one simple concept – ease of use. That's why it comes in a portable, compact controller that also allows you to quickly inflate and deflate the cuff.

And it features an intuitive interface and a large, clear display that lets you see cuff pressure measurements from 2 meters away.[9] Combine that with a versatile mounting system and 13 hours of battery life when fully charged, our cuff pressure manager delivers high-performance design that meets everyday convenience.

## Protection features that provide standout safety

Reducing the risk of cuff overinflation and underinflation is just one way our cuff pressure manager protects your ventilated patients. Safety components such as cuff leakage detection and a filtered extension tube also combat ventilator-associated complications by reducing leakage of accumulated secretions[10] and filtering bacteria and viruses if the cuff leaks or breaks.[11] The extension tube's shut-off valve safeguards your patient by maintaining cuff pressure, even if the tube accidentally disconnects from the device.[12]

# Puritan Bennett™ cuff pressure manager features

## Two operating modes

- Measure
- Control

## One-click inflation and deflation

- Press one-click inflation button to inflate cuff to 25 $cmH_2O$
- Press and hold one-click deflation button for at least 2 seconds to deflate cuff

## Time-limited pressure hold

Ideal for scenarios when higher cuff pressure is necessary for a specified period including:

- Oral cleaning or mucous suctioning
- Assessing lung function with an elevated applied airway pressure

## Multiple mounting options

## Supports cuffed endotracheal tubes

Sizes 3–10 (inner diameter)

## Supports cuffed tracheostomy tubes

Sizes 2.5–10 (inner diameter of outer cannula)

| Technical performance | |
|---|---|
| **Pressure setting range** | 5 $cmH_20$ – 50 $cmH_2O$ |
| **One-click inflation default target pressure** | 25 $cmH_2O$ |
| **Pressure hold target pressure increase** | 5 $cmH_2O$ |
| **Pressure hold time setting range** | 5–30 minutes |
| **Pressure hold time factory default setting** | 5 minutes |
| **Device system accuracy†** | ±2.5 $cmH_2O$ |

| Mechanical specifications | |
|---|---|
| **Cuff pressure manager** | Maximum dimensions: 120 mm x 145 mm x 59 mm<br>Maximum weight: 450 g (0.99208 lb.) |
| **Cuff pressure manager display** | 57.54 mm x 111.2 mm x 4.75 mm, 3.2″ diagonal |
| **Battery** | The battery charges itself while the cuff pressure manager is powered on and connected to AC power. Takes up to 12 hours to fully charge battery. |
| **Warranty** | Cuff pressure manager – 12 months from date of shipping |

## Ordering information

| SKU | Description | Components |
|---|---|---|
| 180-03 | Cuff pressure manager | Cuff pressure manager, mounting rack, battery, and AC/DC adapter |
| 180-05 | Extension tube (10 pieces) | |
| PT00095341-SP | Rechargeable battery | |

**Make the Puritan Bennett™ cuff pressure manager yours. Contact your Medtronic sales representative to learn more.**

† Device system accuracy is the accuracy threshold between the displayed cuff pressure value and the cuff pressure as measured by a reference device.
